

# F T

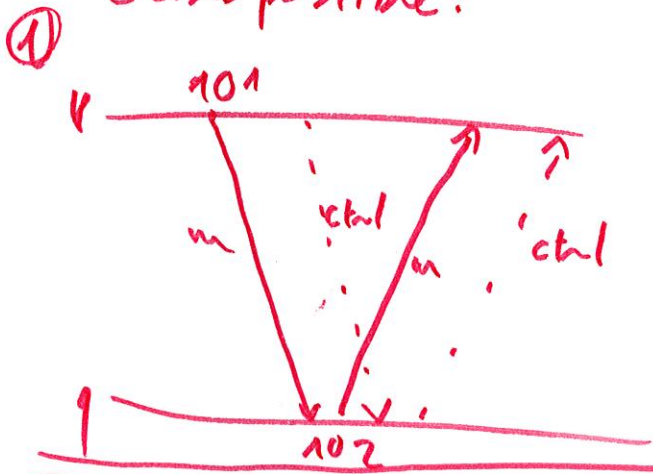

• FIFO: capture in transit messages ensure consistent cut else

• in transit messages are stored in a per-channel basis thanks to the FIFO ordering: an in-transit message is between the snapshot and the control message ~~for~~ on the considered channel

2 cases possible:

$S_p = 101$   
 $S_q = 102$   
 + message  $m$  resent (to P)

$S_p = 101$   
 $S_q = 105$   
 But Q will resend  $m$  at restart (it was treating the message)
